

Editorial Note on Multiple Sclerosis

Received: March 18, 2021; **Accepted:** March 22, 2021;
Published: March 27, 2021

Multiple sclerosis is a chronic disease that affects the central nervous system, especially the spinal cord, brain, and optic nerves. This can lead to wide range of symptoms throughout the body.

[Insights in Biomedicine](#) journal aims to encourage interdisciplinary discussions and contributing to the advancement of medicine, benefiting readers and authors by accelerating the dissemination of research information and providing maximum access to scholarly articles.

As more lesions develop, nerve fibers can break or become damaged. As a result electrical impulses from the brain do not flow smoothly to the target nerve. This means that the body cannot carry out certain functions.

Signs and symptoms of MS vary widely and depend on the amount of nerve damage and which nerves are affected. Some people with severe MS may lose the ability to walk independently or at all, while others may experience long periods of remission without any new symptoms.

All articles published by [Insights in Biomedicine](#) are made freely and permanently accessible online immediately upon publication, without subscription charges.

Multiple sclerosis signs and symptoms may differ greatly from person to person and over the course of the disease depending on the location of affected nerve fibers. Symptoms often affect movement, such as numbness or weakness in one or more limbs that typically occurs on one side of your body at a time, or your legs and trunk.

Peer-review is the system used to assess the quality of a manuscript before it is published. Researchers in the relevant research area assess submitted manuscripts for validity and significance to help editors determine whether the manuscript should be published in their journal.
